What is Vermaktiv Stimul

Vermaktiv Stimul is a non-toxic, completely harmless product without negative effects on nature, the human population, plants, and all flora and fauna living in any habitat.

Vermaktiv Stimul is made from natural materials and components that enhance the nutrition and growth of plant tissue and cause root growth, improve rooting and vegetation development of all plants.

What is Vermaktiv Stimul

Vermaktiv Stimul is an organomineral stimulant that is absorbed by plant tissue and root system. It is a fractionated, specially treated animal and plant extract containing organically bound phosphorus and nitrogen. In addition to these elements, several groups of amino acids, enzymes, hormones, and other natural biostimulatory agents are included. This extract is absorbed by the plant tissue and also by the root system. Because only pure natural materials are used, there is no accumulation of harmful substances and the plants or fruits are edible immediately after treatment.

As the plant tissue absorbs Vermaktiv Stimul, the effect is very rapid and minimal concentrate doses are needed. Two hours after application, it is no longer possible to wash the applied product from the plants. Excess of the product, which soaks to the root ball, increases the amount of soil bacteria, prevents the formation of mold and improves the assimilation properties of the root system. This ensures better nutrient absorption and higher plant resistance.

For every crop

For more than 20 years, we have been developing Vermaktiv in cooperation with Charles University in Prague and Mendel University in Brno concentrating of its effects for a wide range of crops.

- Hops
- Grapevine
- Apples
- Apricots
- Strawberries
- Peaches

Vermaktiv Stimul will help older orchards regain their original crop vitality and increases the yield of good fruits up to 50%.

Results

The official report of the Podlipan Vitice Agricultural Cooperative

On April 10, 2008, after pruning, Vermaktiv Stimul spraying was applied to a local Golden Delicious apple orchard named Patera (83 ha) in the ratio of 1: 1000. During the 8-day follow-up, active callus formation and increased dormant activity (untreated control) were found.

On May 8, 2008, the following was found in the control of the sample: There was a significant increase in young shoots and a significant increase in flower calyx and earlier flowering compared to the control.

On August 8, 2008 at the time of differentiation of flower buds, Vermaktiv Stimul was applied in a ratio of (1: 500) and (1: 1000). In addition, the above sample on April 22, 2009 found an increase in the number of flower buds by 40% and 15%, respectively, compared to the control. In the harvest, we noted a 15% increase in yield with an emphasis on an increased proportion of quality fruit by 50%, against control.

ZD Podlipan Vitice states that the declared efficacy of Vermaktiv Stimul has been verified. The product will continue to be used by ZD Podlipan and extend its use to other areas and other crops.

Results

These apple trees grew in a contagious area (scab - shown below) and were not infected.

The protection of trees and fruits is the result of an autoimmune reaction induced by Vermaktiv Stimulus, which increases the immune response throughout the plant system, and the plant is able to overcome the infection.

A common crop from the same orchard.

"Rosana"

"Rubinola"

"Melodie"

"Florina"

Results

“The yield of corn was 28% higher in treated areas. Harvested grain from the treated area had 10% less moisture than grain on untreated control.”

ZD Podlipan Vitice, divize
obilnářská, Czech Republic

“Compared to the control, peppers increased by 11.7 g, 3.9 mm increased the defensive thickness of sprayed amino acid foliar fertilizer, and body weight increased by 10.1 g.”

Beijing Biore Biotechnology Co,
Ltd, China

“In the harvest, we noted an increase in yield of 15%, with an emphasis on an increased proportion of high-quality fruit by 50%.”

ZD Podlipan Vitice, divize
sadařská, Czech Republic

Vermaktiv Stimul

- Promotes faster seedling growth and a faster green area growth of up to 36% for all plants.
- The proportion of humus in the soil can be doubled over 3-5 years 50%.
- Revitalizes over-fertilized soils and is suitable for all crops.
